Project Status Report 1

- **Anup -** I worked on the project draft, attended multiple meetings to discuss the UI/UX side of the project, discussed the features of the app, and presented the initial UI layout to get everyone on the same page. I helped create the Trello workspace and set up the initial boards for the tasks.
- **Keshav -** Throughout the week, I was working on creating the API design and the Database design for the backend functionality of the software project. Throughout the week, I worked on small iterations of creating a sample of the database, followed by the REST API that would handle the data. I created the initial Github repository that would be used by our team for the duration of the project.
- **Fernanda -** For our group project I will be contributing as a front-end developer, since we are still in the planning stages, I have been participating in team meetings, discussing our following steps and helping brainstorm the application's design and interface. I also helped create some of the other project artifacts such as our SCMP.
- **Chun -** Discussed various features of the project and helped decide the pros and cons of features from the perspective of backend design. Worked on the various aspects of the project proposal draft and finalized details.
- **Xiaoyue -** I worked on the project draft and final document. I attended all meetings to discuss the function and design of the software.

Minutes of the meeting:

Meeting 1:
We discussed various ideas for the project and everyone presented their ideas and motivation for the project. We then discussed the project feasibility and voted on the project and the name of the project.

Meeting 2:
We discussed the pros and cons of various features of the project and settled on which features would be implemented in the project. Once that was settled, we began drafting the project proposal report and everyone worked on different parts of the draft.

Meeting 3:
We continued working on the project proposal report and further discussed the features and functionality of the application to finalize the report. We set up the GitHub repository and Trello workspace to begin the tasks of the project.
